

Data.Manager

Typical electronic management implementations bring data from across the enterprise in various formats and technologies. This makes the cost and complexity of maintaining system connections and ensuring data availability across all environments burdensome for many organizations.

Data.Manager centralizes the configuration and management of data integrations plus including any changes between systems to enable simple and seamless communication across your different technology platforms. Data can easily be extracted from the warehouse and pushed into a reporting tool such as Power BI or directly into a database.

Key Features

- Send data on request to data consumers
- Separate data consumer and data location via automatic configuration updates
- Cache data to improve performance and seamlessly handle temporary network failures
- Prepare and present data for applications in accordance with format requirements
- Connect data to other data sources as needed
- Render chemical structures using ChemAxon technology
- Add and manage data sources as your organization evolves (with training from **a-tune**)
- Connect TrackWise and SAP
- Integrate on-premises data sources via SaaS implementation - no need to setup VPN
